Core problems identified	User personas covered	Root cause identified	Product recommendations

This teardown examines three interconnected product failures in Pronto's house help booking experience. Partners are assigned only 15 minutes before the booking time, leaving no window to track, reassign, or fix anything before the service slot begins. When something goes wrong, whether a partner is not found or an assigned partner does not show up, all resolution happens reactively after the slot has already been wasted. The chatbot does not proactively surface reschedule or partner change options, and getting a human representative requires sustained effort with very slow response times. Together, these failures directly erode retention in a segment where trust and reliability are the entire value proposition.

Pronto is a house help focused platform operating in the Gurgaon and Delhi NCR region. Unlike Urban Company which offers a broad range of home services, Pronto is singularly focused on house help. This singular focus is both its USP and its vulnerability. When house help fulfillment fails, there is no fallback service to retain the customer. Every failure is a complete failure.

The house help market in urban India is one of the last major unorganised segments. Platforms like Pronto are attempting to organise this market by offering scheduled, verified house help on-demand. The promise is simple: book in advance, get reliable help at the right time. The problem is that this promise is frequently broken, and the product resolves every failure reactively, after the booked time slot has already passed.

What Pronto Does Well	Where the Gaps Are
Focused entirely on house help, which builds specialised trust in one category Offers both instant and scheduled bookings Provides sub-service options: utensil cleaning, house cleaning, plant care, clothes cleaning Affordable pricing with clear service categories	Partner assigned only 15 minutes before booking, leaving no time to fix anything before the slot No live tracking during the pre-service window before partner assignment No automatic reassignment if assigned partner does not show up Chatbot shows cancel option but cannot confirm if partner is coming or give ETA without cancelling Human representative takes very long to respond and closes ticket if customer goes offline

Two buyer types were identified based on real usage patterns in urban households in Gurgaon and Delhi NCR. Both depend on house help in different ways but face the same core product failures with compounding consequences.

Persona 1: Sunita, 42, Homemaker

Profile	Goals	Impact of Failure
Age: 42 City: Gurgaon Role: Full-time homemaker and household manager Tech comfort: Moderate Booking style: Pre-books morning slots regularly	Coordinate house help with daily schedule of cooking, errands, and household tasks Have help arrive at a predictable time so she can plan her day accordingly	When help does not show up with no notice, she must do all chores herself on top of everything else planned No tracking means she waits at home without knowing whether to expect anyone Cancellation with no reschedule means starting the booking process all over again

Persona 2: Harsh, 27, Working Professional

Profile	Goals	Impact of Failure
Age: 27 City: Gurgaon, Sector 84 Role: Salaried professional with fixed daily routine Tech comfort: High Booking style: Pre-books the night before or early morning before leaving	House is cleaned before or while he is at work No waiting required, help arrives at scheduled time Return home to a clean space without disruption to work schedule	If help does not show up there is no communication. Either leaves the house uncleaned or waits and gets late for work If partner is assigned but not coming, must cancel manually. Chatbot cannot confirm if partner is coming. Getting a human takes very long and if offline the ticket is closed abruptly

REAL EVIDENCE

A real booking placed on the Pronto app showed the confirmation screen with the message: "We are sorry for the delay. We are still finding the right partner for your booking and will update you soon." The booking was for Hourly Services, 1 hour, at Rs 99, for an address in Sector 84, Manesar, Gurgaon. The partner was never assigned and the booking was eventually cancelled with no proactive notification to the customer. This is not an edge case. It represents the core reliability gap in Pronto's fulfillment system.

03

Problem 1: Late Partner Assignment

Pronto assigns a house help partner only 15 minutes before the scheduled booking time. This happens regardless of how far in advance the customer pre-booked. A booking made 12 hours in advance receives the same 15-minute assignment window as a last-minute booking. This single decision is the root cause of every other problem in this teardown.

WHY THIS IS THE ROOT CAUSE

Because assignment happens at T minus 15 minutes, there is no time before the service window to resolve anything. If the partner is unavailable, there is no time to reassign. If the customer wants to change the partner, there is no time to do that either. If the app detects a problem, it is already too late to fix it before the slot. Everything that goes wrong is resolved reactively, after the booked time has already passed. Urban Company assigns the partner immediately after booking, which gives both the platform and the customer ample time to track, reassign, or change before the service window begins.

Pronto vs Urban Company: Partner Assignment

PRONTO

Partner is assigned only 15 minutes before the booking time. No tracking is possible before this window. No time to reassign or change partner before the slot. All fixes happen after the booked time has passed.

URBAN COMPANY

Partner is assigned immediately after booking confirmation. Customer can track from the moment of assignment. Ample time to reassign if partner cancels. Customer can also change the partner from the app before the service begins.

03b

Problem 2: No Proactive Communication on Partner Status

There are two scenarios where communication fails completely.

Scenario A: No Partner Found

When Pronto cannot find a partner in the 15-minute window, the app shows a message saying it is still finding the right partner and will update soon. No proactive notification is sent. The customer waits without knowing whether to expect anyone. Eventually the booking is either cancelled by the app or by the customer manually. At this point the app does offer a reschedule or cancel option, but with no information on when a partner might be available, most customers end up cancelling.

Scenario B: Partner Assigned but Not Coming

When a partner is assigned, the app does show live location and ETA from that point. However, if the assigned partner is not actually coming or is unreachable, the ETA keeps showing without any update. The customer has no way to know through the app whether the partner is genuinely on the way or not. The only option is to cancel manually. Pronto does sometimes send a replacement partner, but this only happens after the customer has spent significant time and effort engaging with customer care. By the time a replacement arrives, it is typically more than two hours past the original booked slot. The issue is not that Pronto cannot send someone else. The issue is that this entire process happens reactively after the slot is wasted, instead of proactively before it begins.

Pronto vs Urban Company: Partner Status Communication

PRONTO

If partner is not found: app shows a waiting message. No proactive notification. Booking eventually cancelled. If partner is assigned but not coming: ETA shows but no update on actual status. Customer must cancel manually and follow up with customer care for a replacement, which takes over 2 hours.

URBAN COMPANY

Partner is assigned immediately after booking. Live tracking and ETA available from that point. If partner cancels, app automatically reassigns another partner at the same time slot. Customer can also proactively change the partner from the app before the service begins.

03c

Problem 3: Customer Support Cannot Resolve Failure in Real Time

When a booking fails, the customer contacts support through the in-app chatbot. The chatbot does show a cancel option. However, if the customer does not want to cancel and simply wants to know whether the partner is coming or when they will arrive, the chatbot cannot answer that. It requires multiple follow-ups to reach a human representative. Even after reaching a human, response times are very slow, sometimes up to half an hour per message. If the customer goes offline while waiting, the ticket is closed abruptly and cancellation is processed automatically without the customer confirming it.

The Support Experience

1

Booking Fails or Partner Does Not Show

Customer waits past the booking time with no communication. Either the app cancels the booking or the customer cancels manually.

2

Customer Contacts Support Chatbot

Chatbot shows a cancel option but cannot confirm whether the partner is coming or give a real-time ETA. Customer who wants to wait and not cancel has no path forward through the bot.

3

Escalates to Human Representative

Multiple follow-ups required to reach a human. Response times are very slow. If the customer goes offline, the ticket is closed and cancellation is processed automatically.

4

Replacement Eventually Sent

If customer persists, Pronto can send a replacement partner. But this typically happens over two hours past the original slot, after sustained effort from the customer.

5

Customer Churns

Having spent significant time and effort to resolve something that should never have required their involvement, the customer loses trust and does not rebook.

All three problems trace back to a single structural decision: Pronto does not pre-commit a partner at the time of booking confirmation. The just-in-time assignment model means that by the time anything goes wrong, the service window has already started or passed. There is no pre-service window in which the platform or the customer can take corrective action.

THE CORE INSIGHT

The time between booking confirmation and the service window is Pronto's biggest unused asset. Urban Company uses this window to assign partners, enable tracking, allow partner changes, and auto-reassign if something goes wrong. Pronto collapses this entire window to 15 minutes, leaving no room for anything to be fixed before the slot. Every failure that currently happens during or after the service window could be resolved before it if assignment happened at booking confirmation.

Problem	Root Cause	User Impact
Late partner assignment	Platform does not pre-commit partners at booking time	No time to fix anything before the service slot begins.
No proactive communication	No partner exists to track or communicate about until T minus 15 minutes	Customer waits with zero information for most of the pre-service window.
No proactive reassignment	All reassignment happens reactively after the slot, driven by customer effort	Replacement arrives over 2 hours past the original booked slot on average.
Chatbot cannot resolve failures in real time	Chatbot is not designed to confirm partner status or surface reschedule options on booking failure	Customer stuck in generic flows at exactly the moment they need a direct answer.

Feature 1: Early Partner Assignment at Booking Confirmation

Shift partner assignment from T minus 15 minutes to the moment of booking confirmation. When a customer books a slot 12 hours in advance, a partner should be reserved and confirmed within minutes of that booking. This is a backend structural change. It does one thing: it opens up the entire pre-service window between booking and service time. That window is what makes every other feature in this teardown possible. Without it, there is no partner to track, no time to reassign, and no opportunity to fix anything before the slot begins.

Feature 2: Live Partner Tracking with ETA from Assignment

Once early assignment is in place, show live tracking in the app from the moment of assignment. If the partner is delayed or unavailable, send a proactive push notification with an updated status well before the service window begins. This mirrors what Urban Company already does and is the minimum expectation of a modern service platform.

Feature 3: Partner Change Option for Customers

Once early assignment is in place, give customers a visible option in the app to change their assigned partner before the service window begins. Urban Company already offers this. A customer who has had a bad experience with a particular partner, or simply prefers someone else, can make that change in advance rather than cancelling entirely. On the platform side, if an assigned partner cancels or becomes unavailable before the service window, the app should automatically reassign another available partner at the same time slot and notify the customer. Both the customer-facing change option and the platform-side auto-reassignment are distinct product features that early assignment makes possible. Neither can exist without the pre-service window that Feature 1 creates.

Feature 4: Smarter Chatbot on Booking Failure

When a booking fails or a partner is not assigned on time, the chatbot should automatically detect the failure and surface three clear options immediately, without the customer having to navigate through generic flows: confirm partner status and ETA, reschedule to the next available slot, or connect directly to a customer support executive. The chatbot stays as the interface but becomes significantly more useful at the exact moment the customer needs a direct answer. Ticket closure should never happen automatically if the customer is mid-conversation.

Feature 1 is the prerequisite for Features 2 and 3. Nothing else can be built meaningfully until early partner assignment is in place. Features 3 and 4 are independent of each other and can be built in parallel in the next sprint.

Feature	Dependency	Impact	Effort	Priority
F1: Early partner assignment	None	High	High	P0: Do Now
F2: Live tracking with ETA	Needs F1	High	Medium	P1: After F1
F3: Auto-reassign and partner change	Needs F1	High	Medium	P1: After F1
F4: Smarter chatbot on failure	None	High	Low	P1: Next Sprint

Success Metrics

Note: All metrics below are directional. Baselines should be instrumented before numeric targets are defined. These are the right indicators to track, not assumed numbers.

Metric	Why It Matters	How to Measure
Partner assignment success rate within booking window	Measures whether early assignment is working and supply is sufficient	Percentage of bookings where partner is assigned more than 1 hour before service time
Booking completion rate	Primary indicator of fulfilment reliability across all personas	Bookings completed as scheduled divided by total bookings placed
Auto-reassignment rate on partner cancellation	Measures whether the platform resolves partner issues before the service window begins	Bookings where partner was replaced automatically before service time divided by total partner cancellations
Chatbot resolution rate on booking failure	Measures whether the smarter chatbot resolves failure cases without human escalation	Failure cases resolved via chatbot options divided by total failure contacts
30 day rebooking rate after a failed booking	The ultimate retention metric: do customers come back after a failure	Customers who rebook within 30 days of a failed booking experience

CLOSING THOUGHT

Pronto's singular focus on house help is a strength if it is executed reliably. The time between booking confirmation and the service window is Pronto's biggest unused asset. Right now that window is collapsed to 15 minutes, leaving no room to fix anything before the slot. Assigning earlier, communicating proactively, enabling reassignment before the slot, and making the chatbot useful at the failure moment would transform Pronto from a platform where problems are resolved after the customer's time is already wasted into one where problems are resolved before the customer even notices them.
