

PRODUCT TEARDOWN

Spinny

Used Car Platform: India

Document Type	Product Teardown and Feature Proposal
Focus Areas	RC Transfer Information Gap and Hub Experience Gap
Author	Harsh Kumar
Based On	Personal user experience with Spinny app and hub visits in Gurgaon and Delhi
Data Source	9,582 used car listings from the Indian second-hand car market
GitHub	github.com/harsh112003/used-car-analysis

1,294+	2	2	7
Cars listed in Delhi NCR	Core problems identified	Buyer personas covered	Product recommendations

This teardown covers two product gaps in Spinny's buying experience. The first is the RC transfer information gap. Spinny has a solid policy for handling same-state RC transfers and the RTO filter helps buyers find regionally relevant cars. However, nowhere on the app does it explain what actually happens after a buyer picks a car. A buyer has to either call customer care or reach the hub to find out, by which point they have already invested significant time. The second gap is the offline hub experience, where inconsistent staff quality breaks the trust the app builds. A related opportunity is also identified around how second owner cars are labelled, where data shows a Rs 2.35 Lakh average gap between first and second owner car prices on the platform.

Spinny is a full-stack used car platform operating physical Spinny Hubs across 30 plus cities in India. It inspects, refurbishes, and resells cars under its own brand, positioning itself as a trustworthy alternative to local dealers. Its core promise is transparent, fixed-price buying with a 5 day money back guarantee.

The RC transfer process in the unorganised market is opaque and stressful. Local dealers use informal methods, often registering cars under unknown third-party addresses and charging undisclosed fees. Spinny has built a better policy internally. The gap is not in what Spinny does but in what buyers know Spinny does.

What Spinny Does Well	Where the Gaps Are
200 point quality inspection on every car Fixed no-haggle pricing with full transparency 5 day money back guarantee on all purchases Home test drive available in select cities RTO state filter helps buyers find cars registered in their region	RC transfer policy exists but is not shown anywhere on the car detail page Buyer must call customer care or visit the hub physically to understand what happens Second owner cars are labelled generically with no context about ownership history Hub staff quality varies significantly across locations No buyer context available to hub executive before a visit, every visit starts from zero

Two buyer types were identified based on real usage patterns and data from 9,582 second-hand car listings. Each persona connects directly to one or both problems.

Persona 1: Rohan, 27, Gurgaon

Profile	Goals	Pain Points
Age: 27 City: Gurgaon (HR26) Job: Salaried, 2 years experience Budget: Rs 5 to 8 Lakh Wants: First owner automatic petrol	Buy a reliable car registered in Gurgaon without broker hassle Complete purchase within 2 to 3 weekends of searching	RTO code is visible on the car card but what it means for RC transfer is not explained anywhere in the app RC transfer information exists only on Spinny blog posts, not on the car detail page where the decision is made

DATA CONNECTION

From 9,582 listings: automatic cars command a 93 percent price premium over manual (Rs 9.0L vs Rs 4.7L median) with nearly equal listing volume of around 4,800 each. Rohan represents the largest growing segment of metro buyers. RC transfer friction at the point of decision is a direct conversion barrier for this segment.

Persona 2: Priya, 32, Noida

Profile	Goals	Pain Points
Age: 32 City: Noida (UP) Job: Mid-level manager Budget: Rs 10 to 15 Lakh Wants: Kia, MG or Skoda, CVT or AMT	Upgrade to a premium used car Wants the hub experience to match the premium feel of the app Wants clear ownership history before deciding	Hub visit feels passive and inconsistent, not premium Staff cannot always explain CVT vs AMT differences A car passed within a family feels very different to a car with multiple unknown owners but the app treats both the same

DATA CONNECTION

From 9,582 listings: MG holds Rs 14.1L and Kia holds Rs 12.5L median resale, confirming Priya's segment is active and growing. First owner cars command a Rs 2.35 Lakh premium over second owner cars (Rs 7.25L vs Rs 4.9L median), showing that ownership context significantly affects how buyers engage with listings.

Spinny has built a solid RC transfer policy but it is only discoverable by calling customer care or visiting a hub and asking the executive directly. No buyer should have to make a phone call to understand something this basic before deciding to buy a car.

What Spinny Actually Does

Scenario	What Spinny Does	What the Buyer Sees on the App
Same state transfer Example: HR07 Ambala to HR26 Gurgaon	Spinny handles the full RC transfer. Only the name and address change. The car number stays the same. All fees covered by Spinny.	Nothing. RTO code is visible on the card but no explanation of what it means for the buying process.
Interstate transfer Example: HR Haryana to DL Delhi	Spinny does not handle this. Buyer must manage NOC and re-registration independently.	Nothing. Buyer discovers this only after calling customer care or reaching the hub and asking directly, by which point significant time and intent has already been spent.
Same city transfer Example: HR26 Gurgaon to HR26 Gurgaon	Straightforward transfer handled fully by Spinny. Simplest and fastest case.	Nothing. Even this easiest case is not communicated to reassure the buyer.

REAL EVIDENCE

A buyer found a car registered as HR07 on Spinny. Nothing on the app explained what the RC transfer would involve. After calling customer care, the first advisor did not have complete information and had to escalate to a Delhi NCR specialist representative who then confirmed that since both addresses are in Haryana, Spinny would handle the full transfer. The information required two escalations and over an hour of waiting. It should be two lines on the car detail page.

User Journey: Where the Information Gap Hits

1	Opens the App Buyer selects Delhi NCR and sees 1,294 cars. Uses RTO state filter to narrow down results to cars in their region.
2	Browses Listings Sees RTO code on each card such as HR07 or DL3C. The code is visible but its implication for the buying process is not explained anywhere.
3	Opens a Car Likes the specs and price. Reads the inspection report. Scrolls through the full detail page. Finds nothing about what RC transfer will involve or cost.
4	Doubt Surfaces Wonders what happens with registration since the car is from a different city. Searches within the app and finds nothing. Eventually finds a Spinny blog post via Google.
5	Calls Customer Care Calls Spinny. First advisor does not have complete information and escalates to a regional specialist. Buyer waits over an hour for a callback.
6	Proceeds with Reduced Confidence Buyer either drops off due to uncertainty or proceeds with lower trust in the platform, affecting NPS and likelihood of recommending Spinny.

Feature 1A: RC Transfer Information Card on Every Car Detail Page

Below the car details on every listing, show a section that explains the RC transfer process for that specific car based on the buyer's registered address. Spinny already knows the car's registration state and can detect or ask for the buyer's state. The logic already exists in the call centre script. This feature simply puts that information where the buyer needs it, on the page where they decide.

Same City	Same State, Different City	Different State
Straightforward transfer. Spinny handles everything. Only your name and address will update on the RC.	Spinny handles the full RC transfer. Your name and address will be updated. The car number stays the same. No extra cost to you.	This is an interstate transfer. Spinny will not handle the NOC or re-registration. You will need to manage this yourself. Spinny can guide you through the steps.

Feature 1B: RC Transfer Cost and Timeline Transparency

For same-state transfers that Spinny handles end to end, show on the listing page that the RC transfer is included at no extra cost to the buyer along with an estimated timeline for completion. For interstate transfers where the buyer manages the process independently, show a rough estimate of government fees and NOC charges they should expect to pay. Buyers should know the full picture before visiting the hub, not after. This removes the last uncertainty a buyer carries into the purchase decision.

Feature 1C: Family Transfer Badge for Second Owner Cars

In India it is very common for a car to pass within a family, from parent to child, from one sibling to another. These cars are effectively single-family owned and carry the same care and usage history as a first owner car. Currently Spinny labels all such cars simply as second owner with no further context. A car passed within a family deserves a different label than a car with multiple unknown owners. The Family Transfer badge helps sellers of second owner cars price their car closer to first owner value because the badge gives buyers a reason to consider it seriously rather than skipping past it.

DATA BACKING

From 9,582 listings: first owner cars command a Rs 2.35 Lakh premium over second owner cars (Rs 7.25L vs Rs 4.9L median). A Family Transfer badge for verified single-family cars would give sellers a way to justify better pricing and give buyers meaningful context they currently do not have.

During the document verification process Spinny already conducts, add a check for family transfer patterns in the RC ownership history. If the previous owner shares the same surname or address as the current seller, Spinny can apply the Family Transfer badge with confidence. This keeps the badge verified and fully consistent with Spinny trust-first

brand positioning.

Spinny's app builds strong trust through inspection reports, fixed pricing, and guarantees. But when a buyer steps into a Spinny Hub, the experience depends entirely on the individual staff member they meet. Based on visits to multiple hubs across Gurgaon and Delhi, the quality is deeply inconsistent.

PERSONAL OBSERVATION

At most hubs visited, staff sat passively with no car walk-around, no discussion of engine condition, transmission type, or road performance. At one hub, the executive could not explain the difference between CVT and AMT transmission, which directly affects a buyer comparing automatic options. One exceptional visit where the executive covered every detail proactively resulted in the highest purchase intent of all visits. The difference between a good and bad hub visit is entirely dependent on the individual, not on any product or process Spinny has built.

User Journey: Hub Visit Experience

1

Arrives at Hub

Buyer arrives with high intent from the app. No structured welcome. The executive has no visibility into what the buyer browsed, shortlisted, or their budget from the app session.

2

Car Walk-Around

Quality varies entirely by executive. Some give a thorough walk-around. Most stand passively while the buyer inspects alone.

3

Test Drive

Self-directed with no guidance. No commentary on ride quality, CVT vs AMT smoothness, suspension feel, or NVH levels.

4

Questions

Buyer asks about variants and features. Answer quality varies widely. Some executives cannot explain basic transmission differences.

5

Decision

Buyer leaves with unresolved doubts. High drop-off even when app-based intent was strong before the visit.

Root Cause

The hub visit is treated as an operations problem, not a product problem. There is no buyer context passed from the app to the hub executive before a visit. Spinny already has the buyer's browsing history, shortlisted cars, and budget range on its backend. Building a lightweight internal tool that surfaces this to the executive before the buyer arrives would let every hub visit start from a position of context rather than zero. There is also no structured feedback loop, so Spinny has no real-time visibility into which hubs are performing well and which are losing buyers.

06

Proposed Solutions: Problem 2

Feature 2A: Hub Executive Briefing Tool

Build a lightweight internal tool for hub executives that pulls the buyer's context before they arrive. This includes cars shortlisted, filters applied, budget range, and number of sessions on the app. Spinny already holds all this data. The feature is about surfacing it to the right person at the right time. This gives the executive a 60 second brief before greeting the buyer, enabling a focused and personalised conversation.

Feature 2B: In-App Test Drive Checklist for Buyers

Add a structured checklist inside the app that buyers follow during the hub visit: engine sound, air conditioning, suspension feel, CVT vs AMT smoothness, infotainment, and brakes. This reduces dependence on executive quality and gives buyers a clear framework to evaluate the car themselves, raising confidence regardless of who accompanies them.

Feature 2C: Post-Visit Feedback in the App

After every hub visit, send a short in-app survey: Was the executive helpful? Did they answer your questions? Would you return to this hub? Tie ratings to hub-level performance tracking so low-performing hubs are visible in real time, not discovered months later.

Features 1A and 1B address drop-off before the hub visit and should be built first. Feature 1C is low effort with high trust impact and can be built in the same sprint. Problem 2 features require more internal coordination but deliver long-term retention value.

Feature	Problem	Impact	Effort	Priority
1A: RC Transfer Info Card	P1	High	Low	P0: Do Now
1B: RC Transfer Cost and Timeline	P1	High	Low	P0: Do Now
1C: Family Transfer Badge	P1	High	Low	P0: Do Now
2B: Buyer Test Drive Checklist	P2	Medium	Low	P1: Next Sprint
2C: Post-Visit Feedback	P2	Medium	Low	P1: Next Sprint
2A: Hub Executive Briefing Tool	P2	High	High	P2: Roadmap

Success Metrics

Note: All metrics below are directional. Baselines should be measured before targets are set.

Metric	Why It Matters	How to Measure
Hub visit to purchase conversion rate	Primary indicator of whether RC information removes pre-visit doubt	Purchases per hub visit before and after feature launch
Customer care contacts about RC transfer	If the information card works, call volume on this topic should drop	Support tickets tagged as RC transfer queries per 100 listings viewed
Second owner listing click-through rate	Measures whether Family Transfer badge increases buyer interest in second owner listings	Clicks on second owner listings with badge vs without badge
Post-visit feedback score by hub	Tracks whether hub experience is improving and identifies weak hubs	In-app survey responses tied to hub ID after every visit
Listing page exit rate	If the RC information card is working, buyers should stay on the page longer or proceed to book a visit rather than exiting	Measurable directly from app analytics.

CLOSING THOUGHT

Spinny has built the right policies. The RC transfer process is handled well internally. The inspection and pricing model is solid. The gaps are not in what Spinny does but in what buyers know Spinny does. Surfacing RC transfer information clearly on the car detail page, giving second owner cars the context they deserve through the Family Transfer badge, and making the hub visit feel as trustworthy as the app are the three things that will convert more browsers into buyers.
